Effect of interactive marketing communications channels on service customer acquisition

Abstract

Purpose—The cost of customer acquisition is one of the largest expenses that service firms incur due to loss-generating quotes/proposals. This paper aims to connect interactive marketing communications channels with increased customer acquisition and non-interactive marketing communications channels with decreased customer acquisition by service firms.

Design/methodology/approach— Two field studies utilizing hazard models were used to assess the probability of acquiring a new customer after the prospect first contacts the firm. Multiple discrete hazard models were used to compare channels against each other.

Findings— Three interactive marketing communications channels (word-of-mouth, online review forum, search engine optimization) increased the rate of acquiring a customer over time. The author also compared non-interactive channels (billboard/ signage, direct mail), but the analysis did not reveal any significant impact on acquisition rate by the non-interactive marketing communications channels.

Practical implications – Firms can reduce their cost of acquisition by screening prospects through the marketing communications channel that brought the prospects to the firm. Prospects who arrive via interactive marketing communications channels have an increased probability of becoming a customer over time.

Originality/value—The present study illustrates why the cost of acquisition is so high in the service sector and takes the unique step of linking interactive marketing communications channels with higher customer-acquisition rates over time in a services context. Specifically, interactive marketing channels enable customers to find firms that offer the attributes that they seek, thereby increasing acquisition probabilities and decreasing acquisition costs.

Keywords - Marketing communications channels, Interactivity, Asymmetry, Professional services

Paper type - Research paper

1. Introduction

Conventional wisdom suggests that attracting more leads and generating more activity in the sales department will accelerate customer acquisition and ultimately enhance revenue and profit (Kotler *et al.*, 2006). However, many service firms incur a cost proportional to the number of customers who contact the firms. Providers of professional services (e.g. architects, security firms, contractors, and electricians) respond to customer inquiries with a proposal, each time incurring costs to develop this proposal with no guarantee that the customer will accept the proposal and ultimately generate revenue. The service provider thus faces a risk of excessive loss-generating proposals. As one consultant explains, "... an unqualified lead may cost [the company] days, months, and sometimes years of wasted effort" (Jordan, 2018). In the construction sector, for example, a failed proposal for a routine project can cost \$3,000 to \$10,000 (Buckshon, 2013). Other service firms in industries such as real estate or the financial sector risk incurring costs of marketing to consumers who will not purchase from them because they are not interested in the key selling propositions that the firm offers.

To minimize expenditures on consumers who will not purchase their services, firms must attract inquiries from potential customers (prospects) with a high likelihood of converting to paying customers. Prior work has indicated that attracting prospects likely to convert is possible if the goals of the consumer and the value proposition of the firm are aligned (Vroomen *et al.*, 2005). For example, prospects who seek a high-quality option are more likely to seek out and purchase from firms that offer higher service levels (Vroomen *et al.*, 2005). If a service provider can identify prospects who seek to maximize the firm's key selling propositions, it can minimize expenditures on consumers who are not going to purchase from the firm. The challenge, though,

1
2
3 is that prospects still approach the firm via traditional marketing communications channels, with
4 some marketing communications channels providing vastly more information to prospects than
5 others (de Haan *et al.*, 2016; Srinivasan *et al.*, 2015). Traditional advertising may create
6 awareness, but it may not answer questions about a service provider as well as word-of-mouth
7 can (Beltramini, 1989). The purpose of this paper is to explore which marketing communications
8 channels are most likely to bring prospects to the firm who are likely to become customers.
9

11
12
13
14
15
16
17 Substantial research in the relationship marketing and customer acquisition domains has
18 espoused the importance of marketing communications channels in driving prospect quality
19 (Chan *et al.*, 2011; Datta *et al.*, 2015; Gupta *et al.*, 2003; Reinartz *et al.*, 2005; Thomas, 2001;
20 Verhoef and Donkers, 2005; Villanueva *et al.*, 2008). The consistent finding that certain
21 acquisition channels bring higher-value customers to the firm over other channels provides the
22 basis for this study (Reinartz, Thomas, and Kumar, 2006; Verhoef and Donkers, 2005). The
23 author builds on this foundation by arguing that *some marketing communications channels allow*
24 *prospects to interact with the firm and customize the information they receive, thereby enhancing*
25 *the ability to convert prospects in a timely manner and limiting loss-generating proposals.*
26 This research contributes to the literature on marketing communications channels and customer
27 acquisition by comparing interactive and vs non-interactive channels as well as consumer
28 interaction with the firm (see Table 1 for a summary).

45 The paper proceeds as follows. First, the author draws upon the theory of information
46 asymmetry to argue that poor-quality prospects increase sales costs. Secondly, market
47 communications channels are delineated based on the level of interactivity enabled by the
48 channel. Channels with greater interactivity are more apt to allow prospects to reconcile their
49 wants with the seller's key attributes. Hypothesized effects on conversion rates are tested with a

3 hazard modeling approach using data from a firm that performs home improvement services and
4 a real estate brokerage. The two studies are intended to expand the generalizability of these
5 findings by testing the arguments advanced in this paper within two different service contexts
6 that differ on their emphasis on quality. Following the empirical analyses, the author discusses
7 the results and present theoretical and managerial implications pertaining to customer
8 acquisition.

22 **2. Customer Acquisition and Information Asymmetry**

23
24 Literature in customer relationship management links successful acquisition and retention to
25 greater financial valuations (Schmitt, Skiera, and Van den Butte, 2011; Schulze, Skiera, and
26 Wiesel, 2012; Verhoef and Donkers, 2005). The strength of a firm's customer relationship
27 management (CRM) lies in its ability to identify and acquire new customers and retain these
28 customers to extract value over the customer's lifetime (Kumar and Reinartz, 2016; Lewis, 2006;
29 Lewis, 2005). Customers are considered assets that provide varying degrees of value to the firm.
30 When customers are acquired through discounts, they may not prove to be long-term revenue-
31 producing assets (Lewis, 2006), which puts greater emphasis on firms to acquire customers who
32 seek more than intermittent sales promotions (Lewis, 2006, 2005). However, at the time of
33 acquisition, the customer has thus far created a *negative* net value for the firm due to the cost of
34 reaching this customer from a pool of prospects; the greater the cost of acquisition, the longer the
35 time until the customer provides break-even value for the firm. The heart of any CRM strategy is
36 cost-effective acquisition, which sets the stage for the firm's retention efforts.

2.1 Acquisition Costs

Cost-effective customer acquisition is particularly challenging given that firms spend considerably more money to acquire a customer than to retain that customer. For example, in a study of professional memberships, Thomas (2001) estimated that a professional services organization spent \$26.94 to acquire a customer versus \$2.15 per annum to retain a customer. The high cost of acquisition is largely attributed to the expense of reaching prospects who the firm is ultimately unable to convert. For example, a firm that pursues traditional advertising, such as signage or television ads, spends the same amount per prospect even though only a small percentage of those prospects will be converted into customers. A service provider that spends \$10,000 on a billboard advertisement and acquires 50 new customers as a result of that advertisement incurs an acquisition cost of \$200 per customer, with much of this figure incurred from reaching audiences that have no need of the firm's services.

The aforementioned situation illustrates an application of the theory of information asymmetry. The acquisition cost that the firm incurs is fueled by the asymmetry that exists between firms and consumers in the marketplace (Kirmani and Rao, 2000). Traditionally, the seller often has more information on the seller's quality than the buyer, causing prices to drop because buyers demand a discount for the increased risk of purchasing a low-quality service (Akerlof, 1970). However, when buyers have more information about the buyers' intentions than the sellers do, the prices can rise. Thus, unlike the asymmetry that exists when the seller has more information on their quality than the consumer does and prices decrease as a result, when consumers have more information regarding their intentions, prices increase. In the service context, this is novel and more pronounced because time is perishable, and each time the firm pursues a prospect, it reduces the amount of time they could be using performing paid work. To

1
2
3 illustrate, if a customer wants to remodel their home and obtains three estimates from firms, one
4 of whom the customer already prefers, then the remaining two firms that do not receive the
5 contract incur the cost of providing the estimate but no revenue from the customer. This
6 condition is *consumer asymmetry*, where sellers lack the knowledge of which prospects will
7 provide more revenue than the costs the firm incurs to acquire the customers. When sellers
8 cannot differentiate between those who provide them with profits and those who increase their
9 costs, they incur increased costs due to resources spent on prospects who cost the firm more than
10 the revenue they provide (Thomas, 2001). The cost of prospects would have to be offset by the
11 revenue from the few who purchased the firm's services. To reduce the cost of acquisition, the
12 firm must improve its targeting ability and focus its resources on those prospects who are most
13 likely to provide revenue.

27

28 This paper advances the discussion of acquisition costs with a focused investigation of
29 different marketing communication channels, leading to acquisition in the service sector: those
30 that are more interactive and inclusive and those that are more passive and exclusive. To the
31 extent that one of these approaches is more (or less) effective in quickly converting prospects
32 into paying customers, it may be viewed as contributing to a more (or less) cost-effective
33 acquisition strategy. When discussing quality providers in the professional services sector, firms
34 emphasizing quality will charge more than firms that compete primarily on price.

47 **2.2 Marketing Communications Channels**

48
49 Before prospects purchase from the firm, they move through a funnel where they are exposed to
50 multiple marketing communications channels, including both more and less interactive types of
51 communication (Srinivasan *et al.*, 2015). However, more interactive channels are unique in their
52
53
54
55
56
57
58
59
60

1
2
3 relationship to the message's surrounding content (Stephen and Galak, 2012). *Content-integrated*
4 messaging is incorporated into the medium's editorial content (Russell and Belch, 2005). For
5
6 example, with search engine optimization, relevant sponsored listings (the message) appear
7
8 alongside results of the prospect's web search (the surrounding content). *Content-separated*
9
10 messaging is independent of the medium's content; banner advertising at the top of a webpage,
11
12 for example, need not relate to the contents of the page. Content-integrated messaging has been
13
14 found to be more persuasive because it provides richer and more relevant information (de Haan
15
16 *et al.*, 2016). This is important in the professional services sector because the purchase decision
17
18 is preceded immediately by the proposal stage. At this stage, the prospect may be more informed
19
20 through content-integrated messaging and potentially has more knowledge of the firm and its
21
22 services. Alternatively, the prospect may be relying more on content-separated messaging, which
23
24 puts a greater onus on the proposal to provide information to the prospect.

33 **3. Customer Acquisition via Marketing Communication Channels**

34
35
36 Marketing communication channels traditionally involved reaching out to customers with mass
37
38 media and encouraging them to respond to the appeal (Luo and Donthu, 2006). Marketing
39
40 communication that is initiated by the firm and pushed onto prospects with minimal opportunity
41
42 for interaction is very much alive; in 2015, marketers in the United States spent \$11.9 billion on
43
44 direct mail and \$8.1 billion on billboard and outdoor advertising (Morea, 2016; Palmer, 2016).
45
46 However, this expenditure represented an increase of only 0.1% and 0.01%, respectively, from
47
48 the year prior (Morea 2016; Palmer 2016). Total spending on these passive, non-interactive
49
50 forms of advertising is expected to trend *downwards*, largely because of increased expenditures
51
52 on more interactive forms, such as search engine optimization (SEO) or viral advertising
53
54
55
56
57
58
59
60

1
2
3 (Stivaros, 2016; Verhoef and Donkers, 2005). Passive channels such as television advertising
4 may lead to greater awareness and drive prospects to other channels, but prior work has
5 demonstrated that they lack the ability to evoke a cognitive assessment or conative action (e.g.,
6 purchase) on the part of prospects (Srinivasan *et al.*, 2015). Traditional channels do not allow for
7 two-way communication and thus do not allow prospects to customize the message to suit their
8 specific needs (Villanueva *et al.*, 2008). In contrast, more interactive forms such as search engine
9 optimization, word-of-mouth, or a firm's website allow prospects to gather information that they
10 seek, which moves them closer to purchase (Florenthal and Shoham, 2010; Villanueva *et al.*,
11 2008; Vroomen *et al.*, 2005).

17
18
19
20
21
22
23

24 The nature of emerging channels (such as digital communications channels) allows for
25 prospects to customize the information that they receive so that they can assess the message on
26 the attributes of the firm in which they are most interested (Chan *et al.*, 2011; Lagrosen, 2005).
27
28 The preceding example illustrates a key delineating feature of marketing communications
29 channels: their level of *interactivity*. Interactivity is defined as “an expression of the intent that,
30 in a given series of communication exchanges, any third (or later) transmission (or message) is
31 related to the degree to which previous exchanges referred to even earlier transmissions”
32 (Rafaeli, 1988, p. 111). Though there is much debate over what constitutes interactivity (see
33 Kiousis, 2002), there is general agreement that it is captured in two factors that distinguish
34 interactive communication from passive communication: 1) the ability to receive and respond to
35 messages (Heeter, 1989; Rafaeli and Sudweeks, 1997; Rafaeli, 1988; Shannon and Weaver,
36 1949), and 2) the level of control that the receiver has in crafting the message (Downes and
37 McMillan, 2000; Hoffman and Novak, 1996). This distinction matters in the discussion of
38 alleviating asymmetry via marketing communication channels because it allows for the customer
39

59
60

1
2
3 to obtain the most pertinent information for the service provider. In the classical sense of
4
5 interactivity, the two-way communication happens in sequence and simultaneously between
6
7 individuals, like a conversation (Shannon, 1948). In marketing communication, this would be
8
9 similar to word-of-mouth communication. However, increasingly digital channels are also seen
10
11 as facilitating interactive communication (Sundar *et al.*, 1998). These are digital channels that
12
13 allow prospects to engage in sequential communication that leads to a customizable message for
14
15 the prospect (Hoffman and Novak, 1996; Sims 1995). For example, a prospect may initiate a
16
17 search for a firm online; they can choose which hyperlink they follow and gather information
18
19 that pertains to their needs (Kiousis, 2002). The prospect is communicating in the digital realm
20
21 what they communicate in the physical realm. Searching for a plumber via an online search and
22
23 then narrowing the search based on which ones can perform a certain job is similar to the
24
25 communication sequence of asking a colleague if they know any plumbers and which can do a
26
27 particular job well. This ties directly into the central argument that prospects who go through
28
29 particular marketing communication channels may have a higher likelihood of becoming an
30
31 actual customer. The engagement that interactive channels provide allows prospects to find
32
33 information most relevant to them. This would help customers find the right firm for them
34
35 because the channels help customers to screen firms before contacting firms they are interested
36
37 in. A prospect who is concerned with quality can read reviews for the firm on an interactive
38
39 online forum and reach out to only those firms that were perceived as having the greatest quality.
40
41 A prospect who prioritizes responsiveness in the service provider may use digital channels (e.g.
42
43 review forums) to screen out any that do not respond quickly and only contact those that are
44
45 most likely to reply quickly. From the service provider's perspective, the firm may use the
46
47 marketing communication channel to reach prospects who have determined the key selling
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 attributes of the firm and have reached out because the firm is more in line with what the
4
5 prospect seeks than other firms in the same service sector.
6

7
8 The argument is displayed in Figure 1. Interactive marketing communications channels
9
10 allow prospects to determine the key selling attributes of the service provider above what non-
11
12 interactive channels (such as direct mail and signage) are able to convey. Non-interactive
13
14 channels such as television, radio, and signage typically reach a large group of prospects with a
15
16 consistent message (Bezjian-Avery *et al.*, 1998) and are generally used to create awareness
17
18 within a broad group of prospects (Trusov *et al.*, 2009). Acquiring a broad group of prospects
19
20 can be detrimental to those in the service sector because, for some, it creates costs in the form of
21
22 proposals; for others, it involves making an investment in time and effort before the prospect is
23
24 converted. The challenge to the firm is that it lacks information, *ex ante*, on the likelihood that a
25
26 prospect can be converted into a customer.
27
28
29

30
31 ---- Figure 1 about here ----
32

33 Passive, non-interactive channels often employ a shotgun approach by reaching as many
34
35 prospects as possible and, as a result, they reach many prospects who are not interested in the
36
37 firm's offerings. These prospects may not be able to ascertain whether the firm excels at the
38
39 attributes in which the prospect is most interested.
40
41

42 To alleviate the problem of directing resources to prospects who are unlikely to make a
43
44 purchase, interactive marketing communication channels serve as screening filters. As noted,
45
46 these channels inherently support content-integrated messaging, with the prospect seeking out
47
48 the medium for the message and receiving more relevant information (de Haan *et al.*, 2016).
49
50 Interactive methods, such as word-of-mouth, review forums, and search engine optimization, are
51
52 initiated by the prospect who also controls the flow of information (Florenthal and Shoham,
53
54
55
56
57
58
59
60

1
2
3 2010). A customer begins with a search of what the customer is looking for in a firm and then
4
5 conducts her investigation based on those criteria. The firm's message may well be seeded via
6
7 search engine optimization, word-of-mouth marketing programs, and social media campaigns,
8
9 but it is discovered on the prospect's terms and based on the prospect's preferences. A passive
10
11 marketing communications channel is unable to customize the message for each individual
12
13 prospect, which then leaves a gap between the information the prospect seeks and what is
14
15 communicated through the channel.
16
17

18
19 The aforementioned rationale demonstrates that when the prospect is able to interact with
20
21 the message, it can mitigate the asymmetry problem faced by the prospect. Compared to
22
23 messages received from less interactive channels, prospects gain more relevant information.
24
25 Therefore, such channels enable prospects to discern which service providers align more
26
27 effectively with their needs and which do not.
28
29

30
31 To illustrate, a prospect who is considering having their car serviced may study reviews
32
33 online and choose the two businesses with the highest ratings while disregarding others as lower
34
35 quality. A consumer who visits a service garage after seeing a billboard advertisement has done
36
37 nothing to assess quality of the garage and may have to shop around further to reduce the
38
39 probability of taking their car to a low-quality garage. This example demonstrates a competitive
40
41 advantage of interactive marketing communication channels for firms to compete on selected
42
43 attributes. By focusing on drawing in prospects who have already begun to alleviate their
44
45 asymmetry problem (differentiating good sellers from bad), the firm's own asymmetry problem
46
47 (differentiating good prospects from bad) is mitigated.
48
49

50
51 Hypothesis:
52
53
54
55
56
57
58
59
60

1
2
3 **H₁**: The acquisition rate of prospects exposed to a firm's marketing communications in
4 interactive channels will be higher than for those exposed to communications in non-interactive
5 channels.
6
7
8
9
10

11 12 **4. Methodology**

13
14
15
16 The analysis is divided between two studies. In Study 1, the context is the home improvement
17 marketplace. In Study 2, the context is a residential real estate brokerage. In Study 1, the author
18 examines the likelihood of customer acquisition through different marketing communications
19 channels. Study 2 provides a different service context where the service operator relies heavily
20 on an interactive channel (referrals). Both contexts represent different aspects of the service
21 sector; however, in the home improvement context, service quality is identifiable and
22 measurable, thus it can be argued that concerns over quality may cause consumers to opt for
23 certain marketing communication channels over others. Study 2 added a context (real estate)
24 where quality was not as easily discernible.
25
26
27
28
29
30
31
32
33
34
35
36
37
38

39 **4.1 Study 1**

40
41 The home improvement sector represents an industry where service providers vary greatly both
42 in the quality of the services provided and in the overall service experience. U.S. prospects spent
43 over \$325 billion dollars on home improvement services in 2015 alone (Bender, 2016). This
44 sector is seen as an indicator of economic prosperity and employs over nine million people in the
45 United States (United Census Bureau, 2011). The term *home improvement* is quite inclusive;
46 services vary from basic cosmetic upgrades like replacing a floor to larger maintenance issues
47 like roof repair. The study focuses on cosmetic improvements—interior remodeling and
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 painting—that consumers make to their homes. Focusing on cosmetic improvements allows the
4
5 reduction of the potential impact of urgency in the consumer’s decision. The consumer must be
6
7 careful to identify a high-quality firm or risk paying too much for poor-quality work. Some firms
8
9 may even identify a problem that does not exist or a solution that is unnecessary (Pierce, 2015).
10
11 The onus is on the homeowner, who lacks expert knowledge, to evaluate proposals and choose
12
13 the one that is most appropriate for the work that they want.
14
15
16
17
18

19 **4.2 Data**

20
21 The sample was drawn from the customers of a multimillion-dollar, privately held, home
22
23 improvement firm, serving three states and headquartered in a large metropolitan center in the
24
25 eastern United States. The firm offers interior services only (e.g., painting, repairs, cabinetry,
26
27 flooring) to residential homes and is generally perceived as providing superior service. This firm
28
29 consistently receives top marks from online review forums such as Angie’s List and Yelp, where
30
31 it has an average rating of five stars, and an A+ rating from the Better Business Bureau. The
32
33 firm’s main advantage in the marketplace is that it competes on quality and not on price,
34
35 describing its competitive advantage as a “total quality experience” wherein it seeks to provide
36
37 high-quality service and high-quality work throughout its dealings with each customer.
38
39 Each time the firm receives an inquiry, it arranges for one of its employees to visit the location to
40
41 assess the work to be done and then prepare an estimate for the customer’s approval. If the
42
43 estimate is not approved, the firm does not receive any compensation to offset the cost of
44
45 completing the estimate. This situation exemplifies the need to screen prospects because if the
46
47 firm were to expend an equivalent amount of resources on each prospect, then it would
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 overspend on consumers who will never buy and underspend on consumers who have the highest
4
5 likelihood of becoming a customer.
6

7
8 From 2010 to 2013, the firm gave out over 1,500 estimates to prospects in its market
9
10 area. The author evaluated the efficacy of different marketing communication channels by
11
12 assessing the acquisition rates of various means of contact that led the prospect to approach the
13
14 firm. Prospects approached the firm as a result of a variety of forms of contact, some of which
15
16 had been paid for by the firm and others for which the firm did not directly pay. In terms of paid
17
18 forms of contact, the firm utilized direct mail (non-interactive), signage (non-interactive), and
19
20 Google search optimization (interactive). The direct mail campaign involved a flyer promoting
21
22 the firm, which was sent out weekly to potential customers within a bundle of coupons for other
23
24 businesses. The signage for the firm appeared on the firm's fleet of vehicles and on the lawns of
25
26 customers who were having their homes renovated. The Google search engine optimization
27
28 placed a link to the company's website as a sponsored result when prospects entered certain
29
30 keywords for area home improvement firms.
31
32
33
34

35 The primary forms of unpaid advertising contact included word-of-mouth and review
36
37 forums. Although some firms employed marketing programs to incentivize word-of-mouth and
38
39 customer reviews, this firm did not. In this setting, both of these forms of contact originated from
40
41 prior customers who were not compensated to share their experiences. Therefore, this study may
42
43 provide a conservative estimate of the customer acquisition efficacy of these forms of contact
44
45 since the firm had done nothing to seed its own message in these channels. The author identified
46
47 some less common methods of customer contact such as trade shows or the sponsorship of
48
49 charitable endeavors, but these were omitted from the analysis due to their low rates of
50
51
52
53
54
55
56
57
58
59
60

1
2
3 incidence. The author provides a breakdown of the number of estimates per marketing method
4
5 source in Table 2.
6

7
8 ----- Table 2 about here -----
9

10 Because the analysis focuses on customer acquisition, it only included first-time customers. The
11 firm recorded the date the estimate was given and the date the prospect accepts the estimate, if at
12 all. If the prospect had not accepted the estimate within a year, the file was closed, and the firm
13 assumed that the prospect chose a competitor. Each time the firm prepared an estimate, it
14 recorded the type of work to be done, the estimated cost, the marketing channel, and the location
15 of the potential customer. The referral source was provided in response to the prospect's answer
16 to the following question at the time an estimate is given: "How did you hear about us?"
17
18

19 Prospects could state multiple sources, but few did so. To avoid misattribution, only those
20 estimates where the prospect listed one source were used. The author acknowledges that the
21 prospect may have encountered multiple marketing communication channels before approaching
22 the firm (e.g., direct mail followed by a review website). The inability to observe such sequences
23 is a limitation of this study. However, prior work has demonstrated that more interactive
24 channels such as search engine optimization and word-of-mouth are utilized closer to the
25 purchase stage (Srinivasan *et al.*, 2015). The prospect is asked about the channel immediately
26 preceding the proposal—it stands to reason that customers selecting non-interactive media were
27 unlikely to be exposed to the more interactive channels earlier.
28
29

30 **4.3 Hazard Model**

31 To test the argument that inclusive, interactive marketing communication channels increase the
32 rate of acquiring a customer while exclusive, less interactive channels decrease it, the author
33 employed a hazard model. The hazard model is most appropriate to the analysis because it
34
35
36
37
38
39
40
41
42
43
44
45
46

1
2
3 presents an empirical test of the theory that was advanced earlier pertaining to prospects taking
4 time (while costing the firm money) to become customers. Many of the prospects in the sample
5
6 did not become customers (with the firm absorbing the cost of acquisition efforts), and these
7
8 prospects entered and exited the period of analysis at different times; a survival analysis accounts
9
10 for these factors.
11
12
13

14
15 The author used an accelerated hazard model with an exponential distribution to assess
16
17 the probability over time of acquiring a new customer after giving an estimate. Hypothesis 1
18
19 posited that more interactive channels can increase the probability of turning a prospect into a
20
21 customer over time. To demonstrate this conversion, the author had to relax the assumption that
22
23 the differences resulting from all channels are the same across time. The exponential distribution
24
25 had the best fit; the scale result was only one and the plotted hazard did not reveal a significant
26
27 number of variations with respect to time. To ensure the appropriateness of the exponential
28
29 distribution, the log likelihood of the exponential distribution model with a Weibull distribution
30
31 model was compared and found that the former produced a better fit (Exponential, $-2LL =$
32
33 $16,610.62$ versus Weibull distribution, $-2LL = 17103.76$).
34
35
36
37

38 Each of the firm's marketing communication channels identified earlier was included
39
40 within the model (see Table 2 for abbreviations). The range of prices for estimates contained a
41
42 great deal of variation. At the low end was an estimate of \$300 for the painting of one room to a
43
44 high estimate of \$69,275 for renovating multiple rooms within the home. Because the size of the
45
46 project might be correlated with both contact method and conversion likelihood, the author
47
48 controlled for the price of each project by taking the natural logarithm of each estimate (CA;
49
50 Contract Amount). The dependent variable in the model was the likelihood of customer
51
52 acquisition over time $H(t)$, which represents the probability at different time points that the
53
54
55
56
57
58
59
60

prospect will become a customer. The betas represent the impact that the channel has on the likelihood of customer acquisition. The accelerated hazard model is as follows:

$$1) \quad H(t) = 1 - (e^{\beta_0(-1)(t) + \beta_1(WOM) + \beta_2(Re) + \beta_3(SE) + \beta_4(Sg) + \beta_5(DM) + \beta_6(CA) + e_i})$$

The first contact with the customer in the model—time zero—was recorded as the date the estimate was given. If the prospect accepted the estimate, then the event has occurred; if the prospect did not accept the estimate during the three years of the investigation, they were right-censored. If a person arrived at the firm via a personal referral, then they were 67% more likely to become a customer at time (t) in months than if they arrived at the firm through a channel that was not a personal referral. The full results from Study 1 (home improvement firm) are displayed in Table 3. In Table 3, the parameter estimates are listed that indicate the impact that each marketing communication channel has on the probability of acquiring a prospect over time. It should be noted that the author tested for heterogeneity in the effects with respect to project size by estimating interaction effects of the Contract Amount with each marketing channel. The author did not find any significant interactions, thus providing evidence of the homogeneity of the main effects.

---- Table 3 about here ----

The author also investigated whether there were significant differences in terms of acquisition probabilities between the different forms of more interactive channels. Using multiple discrete hazard models, the author compared each channel against the others. Equation 2 represents the general equation for the analysis:

$$(2) \quad h_{it} = \Pr(T_i = t \mid T_i \geq t, x_i)$$

$$x_i = (WOM_i, RE_i, SE_i)$$

1
2
3 The results of the discrete hazard models are displayed in Table 4. A graphical illustration of the
4 probability of acquisition over time for interactive marketing communication channels compared
5 to non-interactive marketing communication channels is contained within Figure 2.

12 ---- Figure 2 about here ----
13
14
15
16

17 **4.4 Findings**

18
19 The primary argument, captured in H1, was supported: it was found that all three interactive
20 marketing communication channels increased the rate of acquiring a customer over time. The
21 results of the discrete hazard models revealed further differences between the channels. Word-of-
22 mouth marketing increased the probability of acquisition above what was provided by the
23 referral forum or search engine optimization. In a comparison of probabilities over time between
24 the review forum and the search engine optimization, the author found significant differences in
25 favor of search engine optimization. Customers who approached the firm from a search engine
26 were more likely to become a customer of the firm over time. The author did not compare the
27 passive, less interactive channels because they had already been revealed as insignificant
28 predictors of customer acquisition in the earlier analysis.
29

35
36
37
38
39
40
41

42 **4.5 Study 2**

43
44 Study 1 examined customer acquisition in a sector where perceived quality fluctuated
45 significantly. As discussed earlier, contractors are rated publicly by consumers, and potential
46 customers are likely to differentiate between poor quality and good quality firms through
47 interactive channels that allow them to extract information to form perceived quality of the
48 contractors. However, the limitation of the first study is that one could argue that interactive
49 channels are best suited for sectors where quality varies widely. For many service providers,
50
51
52
53
54
55
56
57
58
59
60

1
2
3 perceived signals of quality show little variation. For example, prior work has found that in the
4 sharing economy, most of the hosts who offer accommodations for others receive a rating of five
5 out of five stars, there is very little deviation beyond four to five stars (Zervas *et al.*, 2015). To
6 move past the argument that the earlier findings are applicable only to those high-quality service
7 providers who stand out in a market with significant variation in service quality, the author
8 expanded the research to the real estate sector. Unlike other sectors of the service economy,
9 realtors don't have many identifiable signals of quality. Realtors can be rated on different review
10 forums, but the sheer volume of realtors with high ratings minimizes ratings as a signal of
11 quality. According to the National Association of Realtors (NAR), in 2018 there were estimated
12 to be approximately two million active real estate licenses in the United States (NAR 2018). Real
13 estate services represent a service that has a high degree of fit between the clients and providers.
14 In 2018, it is estimated that residential buyers in the United States spent over \$80 billion on
15 purchasing residential properties (O'Connor, 2019).

33 **4.6 Data**

34
35 The sample for Study 2 was drawn from a small real estate brokerage that operated from 2013 to
36 2018 in the suburbs of a major metropolitan area on the east coast of the United States. In 2018,
37 due to declining commissions and increased competition from larger brokerages, the firm was
38 absorbed by a larger brokerage. At the time the firm was absorbed, it had less than 50 agents and
39 prided itself on being a small shop that could give their clients individual attention. The
40 downside is that the agents did not have access to as many resources or as large a network as
41 other brokerages. Agents for this brokerage worked on 100% commission; they could earn
42 commissions (ranging from 2 – 3% of the sales price) as either the buyer's agent or seller's
43 agent. They could also earn commission on the final sale by referring either the seller or buyer to
44
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 another agent (typically 0.1 to 0.5% of the sales price). Once the sale was complete, the agent
4
5 would pay the broker 0.5% of the commission that they acquired.
6
7

8 Due to the potential for commissions, the firm kept track of all referrals, even if the
9
10 relationship did not materialize. Agents were encouraged to keep track of their leads so that if
11
12 any of the prospects reached out to the firm, the broker would know who the assigning agent
13
14 was. The firm also allowed agents to purchase into an automatic postcard mailer that would be
15
16 sent to certain zip codes each quarter. The postcards would promote the individual agent but
17
18 would also provide information to potential customers such as guidance on how to turn off the
19
20 water supply in the winter and how to weed one's lawn in the spring.
21
22
23

24 The majority of agents did not enter their leads into the database. Only eleven agents
25
26 participated, and of those eleven agents, only eight did so regularly. Over the course of 2016-
27
28 2018, there were 308 leads. A total of 165 of these prospects were converted into customers
29
30 while 143 of these leads were considered dead (after six months) or were right censored. It
31
32 should be noted that customer acquisition in this case does not equate to the agent earning
33
34 commission from the client. If a client did not buy or sell a home within a six-month time period
35
36 (when the agency relationship expires), no commission was earned, but the client was still
37
38 acquired. The author was not able to ascertain whether the agents earned commissions from all
39
40 the clients whom they acquired. The agents achieved prospects from four channels: referrals,
41
42 networking, postcard mailers, and open houses. A full description of each marketing channel,
43
44 along with the number of prospects and conversions per channel, is provided in Table 5.
45
46
47
48

49 ---- Table 5 about here ----
50

51 Referrals, networking, and open houses were classified as interactive methods because the
52
53 prospect was able to initiate contact with the sales agent, and they were able to customize their
54
55
56
57
58
59
60

1
2
3 interaction. Postcards were the lone non-interactive marketing channel that drew prospects to the
4
5
6 respective sales agents.

7 8 **4.7 Hazard Model**

9
10 Similar to Study 1, the author employed an accelerated hazard model to test the arguments
11
12 advanced in Hypothesis 1. Prospects contacted the agents at varying times, and some did not
13
14 become customers by the cut-off point; this format lent itself to a survival analysis. The
15
16 appropriateness of the exponential distribution was assessed by comparing the log likelihood of
17
18 the exponential distribution model with a Weibull distribution model and revealed that the
19
20 exponential distribution model was a better fit (Exponential, $-2LL = 1,583.62$ versus Weibull
21
22 distribution, $-2LL = 1602.17$). The author used all four marketing channels in the accelerated
23
24 hazard model; the model is as follows:
25
26
27

$$28 \quad (3) \quad H(t) = 1 - \left(e^{\beta_0(-1)(t) + \beta_1(\text{Referral}) + \beta_2(\text{Networking}) + \beta_3(\text{OpenHouse}) + \beta_4(\text{Post-Card}) + e_i} \right)$$

29
30
31 The first contact with the prospect was recorded as time zero. For the sole, non-
32
33 interactive method--postcards--this was the first time a prospect contacted the agent after
34
35 receiving the postcard. The prospect was recorded as having converted to a customer (conversion
36
37 was recorded as an event) when the prospect signed an exclusive right to represent contract with
38
39 the agent. The results demonstrate that at time t (month), those who approached the firm from a
40
41 referral were approximately 87% more likely to become a client than those who approached the
42
43 firm by another channel. Table 6 lists the parameter estimates for Study 2.

4.8 Findings

The one non-interactive marketing communication channel did not have a significant impact on customer acquisition ($0.374, p= 0.603$). The only marketing channel that was found to have a significant impact on customer acquisition was referral ($(-2.040, p< 0.001)$). The referrer acts to provide a word-of-mouth endorsement of the agent to the potential customer. Similar to word-of-mouth from Study 1, potential customers can ask the referrer questions, thereby interacting with the communicator in order to ascertain the fit between the strengths of the agent and their needs as a client. Also, similar to Study 1, this interactive channel increased the rate of customer acquisition. Neither the networking nor open houses had a significant impact on the probability of customer acquisition. One reason why these interactive channels did not have a positive impact on customer acquisition may have been the interest of consumers when they first encountered the particular channel. Recall from the earlier conceptualization of interactive methods that prospects seek out the medium for the message (de Haan *et al.*, 2016). For both networking and open houses, the customer may not have sought out the channel, but had it thrust upon them. A customer may have visited an open house or met the agent through a networking event, but the activity was what caused the customers to meet the agent. The customer may not have interacted with the agent for the purpose of acquiring real estate representation. Though there may have been a level of engagement with the agent (Rafaeli and Sudweeks, 1997), which qualifies the channel as an interactive channel, the customer may not have sought the agent and thus was an unlikely client before going through the interactive channel. Despite the result not being statistically significant, it is an important finding because it alludes to a boundary condition on the power of interactive marketing communication channels to acquire customers as

1
2
3 demonstrated by Study 1. When the channel is pushed onto consumers, it may lose its ability to
4 increase customer acquisition.
5
6
7
8
9

10 **5. Discussion**

11
12 Interactive marketing communication channels allow the prospect to direct their information
13 search and ascertain the key selling propositions of the service provider in the professional
14 services sector. These channels allow prospects to identify firms that most align with their goals,
15 thereby increasing the likelihood of acquisition. In the home improvement sector (Study 1),
16 interactive channels may favor high quality firms, but in sectors where perceived quality is not as
17 evident (Study 2), the interactive channels allow consumers to assess perceived fit. It should be
18 noted that interactivity may not have a significant impact on consumer acquisition if the channel
19 is pushed onto consumers compared to when it is initiated by the consumer.
20
21
22
23
24
25
26
27
28
29
30

31 Practitioners place a heavy focus on customer acquisition, with lead generation and
32 turning customers into assets frequently cited as marketers' top priorities (Marketing Science
33 Institute, 2018). This focus is justified given that acquisition is often the largest cost that a firm
34 incurs during a customer relationship, and it precedes retention (Thomas, 2001). By connecting
35 marketing channels to customer acquisition, this paper contributes valuable knowledge to this
36 important domain.
37
38
39
40
41
42
43
44

45 This paper revealed that interactive marketing communication channels increase
46 customer acquisition likelihood over time while less interactive channels do not. When
47 customers can interact with the channel, they can better ascertain the attributes of the firm, while
48 channels that are pushed onto prospects hinder the ability to assess the seller ahead of time. The
49 findings support the former statement but not the latter.
50
51
52
53
54
55
56
57
58
59
60

1
2
3 The evidence is consistent with the primary argument that interactivity increases
4 customer acquisition (thereby reducing acquisition costs). Channels that leverage prospects' own
5 self-guided search and self-initiated contact drive prospects towards the firm that has already
6 done part of the work to reduce the information asymmetry issues between the seller and the
7 prospect. The prospect has a greater awareness of the quality of each prospective firm a customer
8 contacts, while the firm's problem of differentiating profitable from unprofitable prospects is
9 mitigated. Due to this reduction in asymmetry, prospective customers who have had contact
10 with the firm via interactive channels have a greater acquisition rate.

17
18
19
20
21
22
23

24 **6. Limitations and Future Research**

25
26 One of the biggest challenges when examining the effect of a method of marketing
27 communication channels on a particular outcome is the interaction and accumulated effects of
28 multiple methods. For example, a prospect may view a billboard for the focal home improvement
29 company enough times to become aware of the firm and ask their neighbor if they have used the
30 firm before. It is possible that the prospect contacts the firm after exposure to passive marketing
31 communications channels. Study 1 relied on consumer self-reporting to determine which channel
32 affected the probability of customer acquisition. The author does not make the argument that
33 each marketing channel operates in a vacuum.
34
35
36
37
38
39
40
41
42
43
44

45 This study accounted for the method that was most salient to consumers when asked how
46 they chose the firm. The process from awareness to action is complex and susceptible to
47 influence at various stages (Payne *et al.*, 1991; LeDoux, 1998). While passive channels such as
48 signage and direct mail may create awareness, more interactive channels largely move beyond
49 the awareness stage because the communication is initiated by the consumer. The study did not
50
51
52
53
54
55
56
57
58
59
60

1
2
3 find that non-interactive channels had a significant impact on customer acquisition, and this may
4 be a sign that their purpose is not conversion but rather awareness. Thus, it is possible that less
5 interactive channels strengthen interactive channels. The author invites future research to explore
6 channels at various stages of the consumer decision-making process.
7
8
9
10
11
12
13

14 **7. Conclusion**

15
16
17 The cost of acquiring a new customer is often several times greater than the cost of retaining an
18 existing customer in a services context. One of the factors that inflates the cost of customer
19 acquisition is that service firms often spend money on prospective customers who will never
20 purchase from the firm. Such expenditures include incurring expenses generating quotes and
21 proposals or selling to a customer who might not generate revenue. To reduce the cost of
22 customer acquisition, the firm needs a method to screen customers and attach a higher
23 probability of acquisition to certain customers than others.
24
25
26
27
28
29
30
31
32

33
34 The study investigated whether service firms would be able to screen prospects based on
35 the marketing communication channels used to reach the firm. Interactive channels such as
36 word-of-mouth and third-party review websites are more engaging and interactive than their less
37 interactive alternatives (such as billboard advertising or direct mail). The author found that
38 prospects were more likely to become customers if they arrived at the firm via more interactive
39 channels. The findings reveal that firms can leverage their service quality through interactive
40 channels to reduce acquisition costs while increasing their optimal acquisition rate.

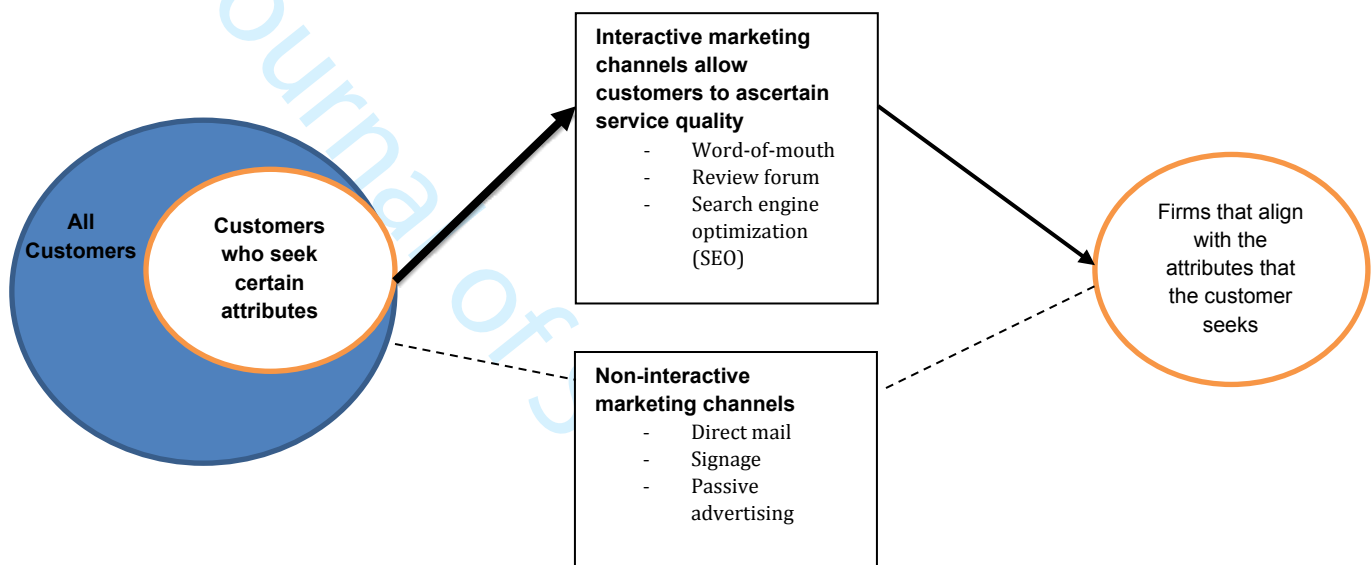

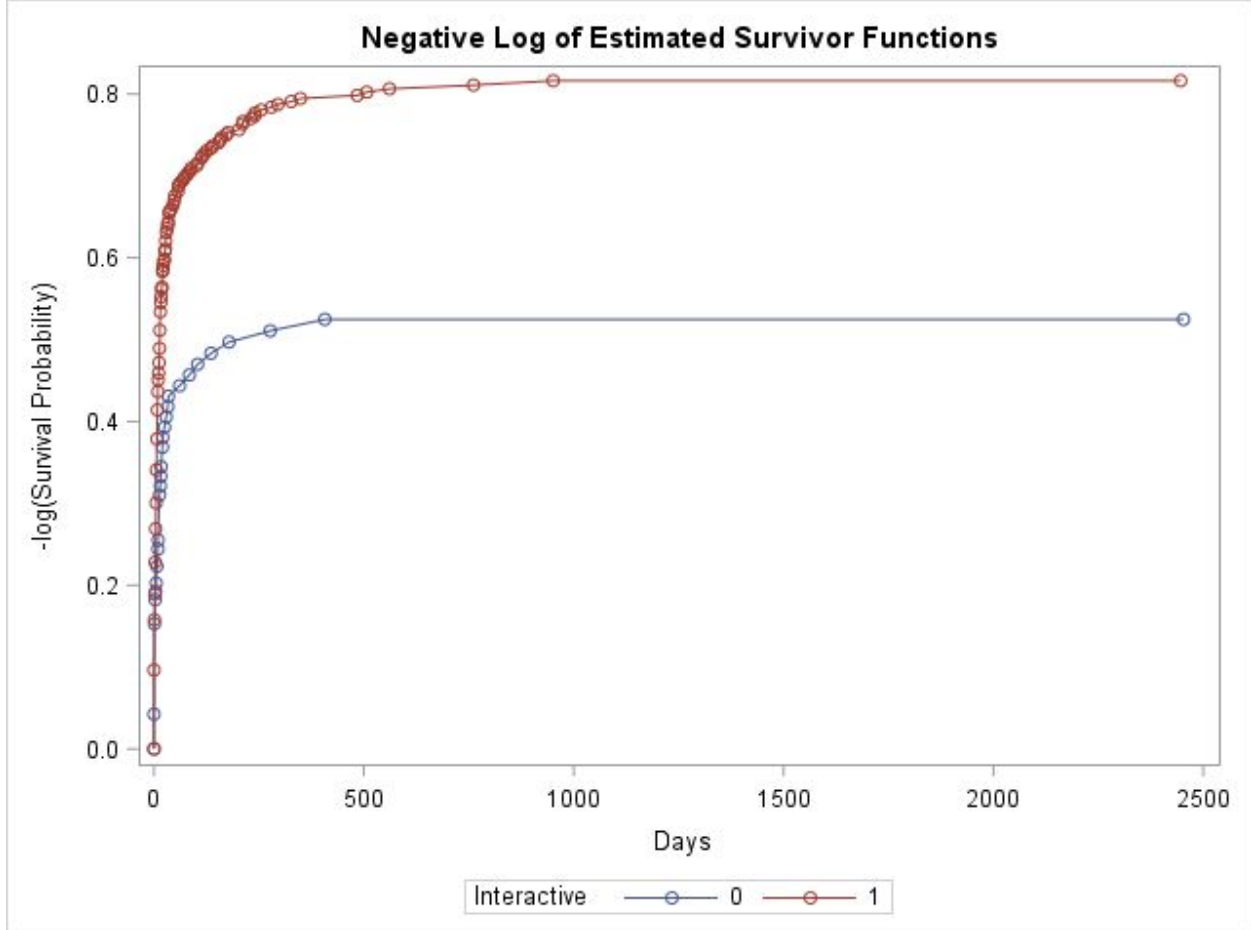

Figure 2
Comparison of probabilities between interactive and non-interactive marketing communications channels

Marketing

Table 1

Outline of contribution relative to other major work

Study	Channels	Variables of Interest		Summary of Key Findings	Industry
		Comparison of acquisition based on interactive vs. non-interactive channels	Consumer Interaction with Firm		
Chan, Wu, and Xie (2011)	Google Search/ Web Traffic		✓	Customers acquired through Google search advertising are more valuable than customers acquired through other digital channels.	Biomedical and Chemical
Datta, Foubert, and Van Heerde (2015)	Direct Mail, E-Mail		✓	Customer value of free-trial customers is lower than that of regular customer but free-trial customers are more responsive to marketing communications.	Digital Media
Kumar, Peterson, and Leone (2010)	Word of Mouth		✓	A new four-step approach to compute customer referral value (CRV) is created. The method is used to target the most promising customers.	Financial Services, Retailing

Libai, Muller, and Peres (2013)	Customer-to-Customer	✓	The authors demonstrate how acceleration and expansion combine to generate value in a word-of-mouth seeding program for a new product.	Higher education, Technology, Entertainment, Retail, and Services
Reinartz, Thomas, and Kumar (2005)	Telephone, Face-to-Face, Web, E-mail	✓	Insights are presented pertaining to how much to spend to balance acquisition vs. retention. The relationship between acquisition expenditure and retention expenditure is demonstrated.	B-to-B High-Tech Manufacturing
Scmitt, Skierra, and Van den Bulte (2011)	Word-of-Mouth	✓	Referred customers have a higher contribution margin, higher retention rate, and are more valuable in the short and long run.	Financial Services
Steffes, Murthi, and Rao (2011)	Internet, Direct Mail, Direct Sell, Telesales	✓	Internet and direct mail efforts generate more profitable customers than telemarketing and direct selling.	Financial Services
Thomas (2001)	Direct Mail	✓	Customer acquisition is more costly than customer retention.	Membership of Trade Association
Trusov, Bucklin, and Pauwels (2009)	Word-of-Mouth	✓	Word-of-mouth referrals have substantially longer carryover in a social networking site than	Social networking

Table 2
Marketing communications channels for Study 1 (home improvement firm)

Referral Source (abbreviation)	Explanation	Mean in days* (SD)	Events	Censored
Personal Referral (WOM) ^a	Referral from a personal acquaintance (professional or otherwise)	452.81 (396.45)	308	219
Review Forum (Re) ^a	The review forum that we drew upon was Angie's List. Angie's list is a subscription based forum that rates service providers and allows members to leave feedback on specific firms.	787.44 (609.61)	145	149
Search Engine Optimization (SE) ^a	The firm pays Google to maximize its presence when consumers in the geographic region conduct searches for home improvement firms. The firm also attempts to create as much traffic to their website so as to optimize their presence when customers search for firms that contain certain keywords.	563.10 (560.10)	56	85
Direct Mail (DM)	The firm uses a direct mail campaign that provides potential customers with a brochure promoting their services and their service ratings.	1364.11 (1136.19)	69	107
Billboard/ Signage (Sg)	The firm pays for bus station advertising on various bus stops throughout the metro area. The advertising lists contact information and contains pictures of the types of work that the firm does.	1321.03 (1101.50)	15	41
^a Inclusive / Interactive Marketing Channels			593	
*Days from first contact with the firm to time of proposal acceptance.			Total	601

^a Inclusive / Interactive Communications Channels

Table 4
Comparison of marketing channels

Comparison	Model Fit Global Test Statistic: Wald	Test of Equality: Wilcoxon	Parameter Estimate
Comparison between inclusive / interactive channels and exclusive / less interactive channels	Chi-Square = 93.671, $p < .001$	Chi-Square = 8.852, $p < .01$	-1.539, $p < .05$
Comparison between word-of-mouth and third-party review	Chi-Square = 74.193 $p < .001$	Chi-Square = 3.681 $p < .06$	-1.628, $p < .10$
Comparison between word-of-mouth and search engine optimization	Chi-Square = 92.334 $p < .001$	Chi-Square = 15.667 $p < .001$	-1.362, $p < .001$
Comparison between third party reviews and search engine optimization	Chi-Square = 37.997 $p < .001$	Chi-Square = 21.035 $p < .001$	1.393, $p < .001$

Table 5
Marketing communications channels for Study 2 (real estate brokerage)

Referral Source (abbreviation)	Explanation	Mean in days (SD)	Events	Censored
Referral	Referral from a previous customer or affiliate partner such as contractors	13.04 (21.41)	53	3
Networking	The realtors attended different events and volunteered with multiple organizations such as amateur sports teams and parent teacher associations. By doing so they developed networks.	35.56 (49.18)	22	10
Open houses	Realtors often host open houses not only for their clients but for other agents as well. The purpose is to meet potential buyers and accumulate contacts for those that are not represented by another agent.	68.14 (53.87)	22	34
Post-Cards	A form of unsolicited direct mail where the realtor provides their contact information as well as information that the homeowner can use such as how to turn off the water to the outside of the house.	56.54 (50.87)	68	96
^a Inclusive / Interactive Marketing Channels		Total	165	143
